

*Serum uric acid as a clinically useful
nutritional marker and predictor of
outcome in maintenance hemodialysis
patients*

Background

High circulating concentrations of UA have been shown to be associated with an increased risk of hypertension, prehypertension, peripheral arterial disease, diabetes mellitus, chronic kidney disease, and cardiovascular disease in the general population.

Feig DI, Kang DH, Johnson RJ. Uric acid and cardiovascular risk. N Engl J Med. 2008; 359 : 1811-1821.

Gagliardi AC, Miname MH, Santos RD. Uric acid: a marker of increased cardiovascular risk. Atherosclerosis. 2009; 202: 11-17.

➤ Its importance as a marker for hemodialysis population remains unclear.

Low Serum Uric Acid Level Is a Risk Factor for Death in Incident Hemodialysis Patients

Study hypothesis & aims

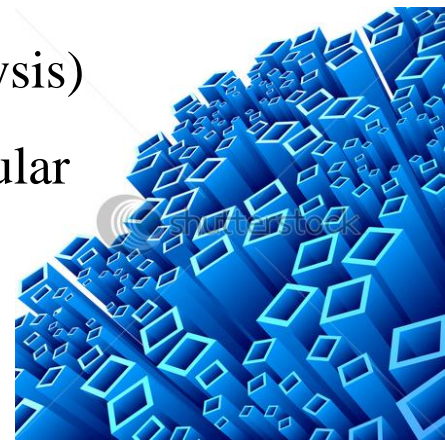

- In order to explain an inverse association of UA levels with survival, we hypothesized that higher UA among HD patients is an indicator of better nutritional status.
- We aimed to investigate the associations of SUA levels with clinical and laboratory surrogates of nutrition and inflammation, muscle function, health-related quality of life, and all-cause and cardiovascular morbidity and mortality in maintenance HD (MHD) patients.

Outcomes & Measurements

➤ **Measurements at baseline :**

- ✓ Serum uric acid (SUA)
 - ✓ Dietary energy and protein intake
 - ✓ Biochemical markers of nutrition and inflammation
 - ✓ Handgrip strength
 - ✓ Nutritional scores (MIS & GNRI)
 - ✓ Short Form 36 quality of life (QoL) scoring system
 - ✓ Body composition (anthropometry and bioimpedance analysis)
- **Outcomes:** all-cause morbidity and mortality; cardio-vascular morbidity and mortality
- **Study period:** 17 months (interquartile range 9.0-24.0 months).

Uric acid in hemodialysis population

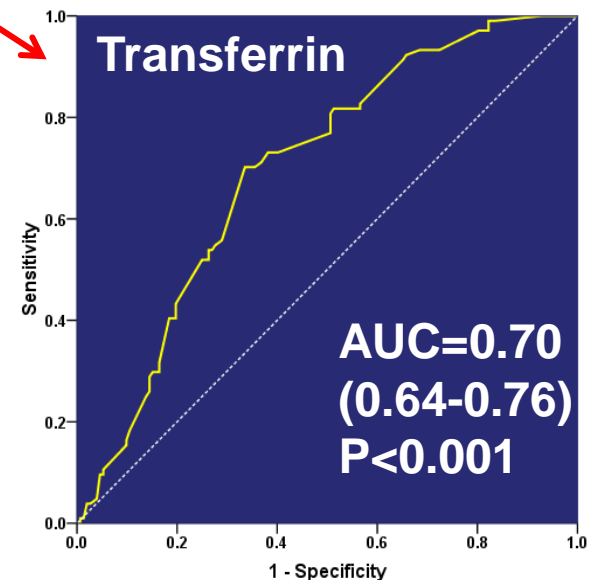

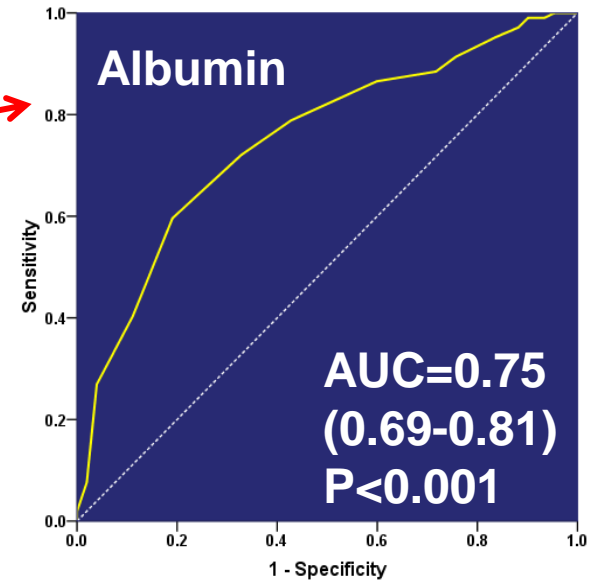

Conclusions

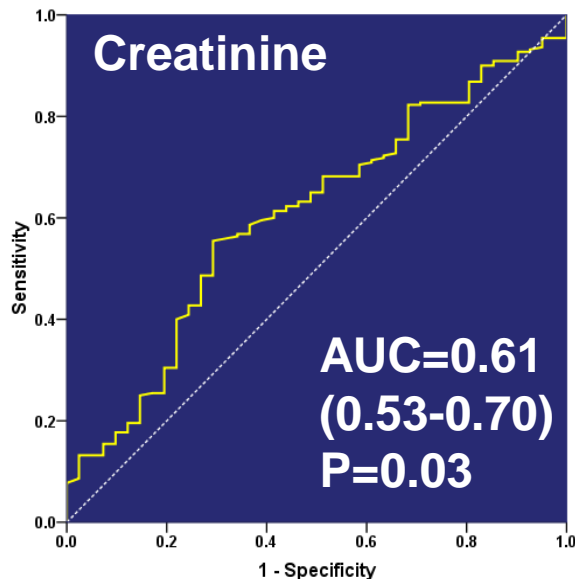

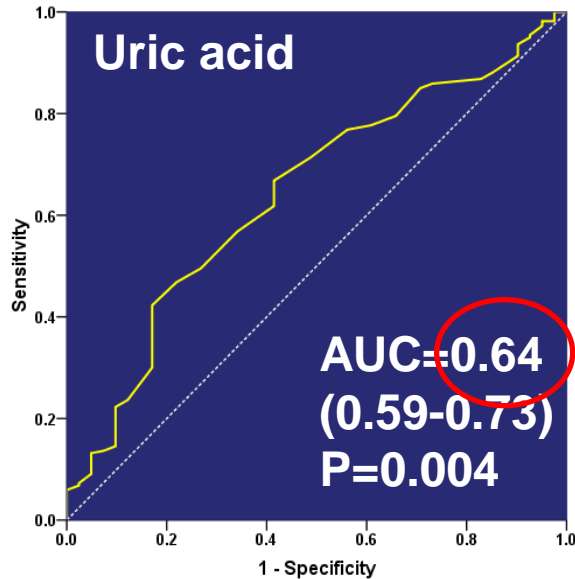

- SUA is a clinically useful marker of nutritional status, associated with most surrogates of body composition, muscle function, inflammation, and health-related quality of life in MHD patients.
- SUA is a good marker of upcoming hospitalizations (both all-cause and CVD), as well as an independent predictor of all-cause and cardiovascular death risk.
- SUA is a simple, easily performed and inexpensive laboratory test that may be used in conjunction with serum albumin in a quick identification of MHD patients at nutritional risk and those needing early nutritional interventions.
